TECHNICAL GUIDE

This technical guide was designed to be used along side one of our the ⚡ | Electric collections specification guides.

If any questions arise please call your local sales representative or contact The Bradley Collection directly.

Electrical installations must be carried out by qualified professionals. In line with the relevant wiring diagrams and conform to local regulations.

Poles are manufactured to suit individual requirements. When calculating the length of your pole, remember to allow tolerance beyond the width of the frame for the curtains to draw back to the edge of the window.

Poles exceeding the recommended maximum distance between brackets, will be cut into equal parts unless otherwise specified. Pole joiners will be supplied. Joining brackets should be placed at every join.

STACKING OPTIONS

With electric systems stacking options are configured at the point of assembly, so must be specified when ordering.

Single or pair stack Ripple/Ripplefold curtain stacking must be specified when ordering as this will affect the number of rollers supplied.

SINGLE STACK

On single stack systems the motor is always positioned on the stacking side. Allowing the motor to be hidden behind the curtain.

PAIR STACK

Double stack curtains can have the motor positioned at either end of the pole.

STACK SIZES

This is the area where the curtains hang against the wall when they are pulled open. by covering the wall and not the glass, during the day, it allows more light into the room. Allow approximately 30% of the length of the track for curtain stacking, very full curtains (e.g. pencil pleat) will need more space than flatter ones. lined and interlined curtains will also require more stacking space than unlined.

STANDARD HEADINGS

Standard rollers will be supplied every 100mm (4") unless otherwise specified.

Rollers can be loaded and removed from either end of the pole after assembly by removal of the spring stop or return cover as shown.

STANDARD
FULLNESS 1.5

Pinch Pleat
Fullness 2.0

ROLLERS

Rollers are preferred for heavy drapery. one roller is specified for every 100mm (4").

RIPPLE HEADING

Ripple is a simple 5 folded heading system consisting of rollers spaced by a cord and a special pocketed header tape that is sewn onto a flat panel curtain. When assembled in the pole, the rollers on the cord are spaced at distance shown below and this fixes the 'pitch' of the ripple. The flat panel curtain(s) are made in the conventional way with the pocketed header tape sewn to the header. Hooks are fitted to header tape at a set spacing creating the ripple effect

RIPPLE

Roller-Cord Spacing	Curtain Hook Spacing	Approx. Curtain Fullness	Stack Depth per 1M (39 3/8") of pole	Min Bracket Projection
80mm (3 1/8")	160mm (6 5/16")	2.3	180mm (7 1/16")	100mm (4")

RIPPLEFOLD HEADING

Ripplefold pleat style is named for the soft, consistent ripples created by the drapery as it hangs from the track. it offers an elegant, contemporary look.

- Ideal for both residential and commercial settings.
- Drapery is constructed with snap tape (graber® is required) that allows the drapery to be snapped directly to the auxillary carriers on the track.
- Fullness of the drapery is determined by the spacing of the carriers in the track. the higher the fullness factor, the more full the draperies appear. Lutron® Ripplefold® tracks are available in 3 fullness factors

	45mm (1 3/4")	120%	360mm (14 3/16")	100mm (4")

Different types of fabric have widely differing weights. The type of curtain heading used (see below) will determine the fullness of the fabric used: this can be anything from 1.5 x the width of the pole to 3.0 x pole width.

The chart below assumes 100% fullness (2.0 x width of the pole) the weights are very approx and can vary for many reasons. Always check the expected and final total curtain weight with the curtain maker. Based on 1200mm (48") fabric width

Maximum weight recommendations for all standard curtain types using gliders & roller are defined to ensure safe and proper function of the electric system. These must be adhered to. See table below for details of all options.

Bends will considerably reduce the load bearing capability of any system.

REMOTE CONTROL

Single channel remote can control one motor or a group of motors at the same time. If you require each motor to run independently then either Single channel remote must be specified for each window or a multi channel remote needs to be specified

Multi channel remote can control multiple motors independently or grouped together. This option needs requires the motor to either have RTS built in or RTS module through a control system.

APP CONTROL

The system can be controlled with the Somfy Tahoma app or through smart devices & Amazon Alexa.

The system can also be integrated with all major home control systems.

This option needs requires the motor to either have RTS built in or RTS module through a control system.

AUTOMATION SYSTEMS

The system can also be integrated with all major home control systems.

This will require additional components and the system being installed & composing by automaton specialist's

From smart application to home automation, the most complete & evolutive connected experience with the TaHoma environment

- From the touch of a button, to app control, all the way to voice control, TaHoma switch offers an accessible to all and scalable smart home solution.
- Tahoma switch controls key home equipment from Somfy and major partner brands (shades, shutters, doors, gates, windows, heating, lighting, cameras, alarm systems and more) for more security, greater energy efficiency and enhanced comfort every day.
- Thanks to the native integration of the io-homecontrol, RTS and Zigbee 3.0 protocols along with cloud compatibilities Tahoma switch is an evolutive solution, that allows people to add equipment as they'd like.
- TaHoma switch is also compatible with Google Assistant and Amazon Alexa enlarging the user experience to voice control.
